Python Project - Week 1

Variables and Conditional Statements - Character Setup

Today's goal

Use variables, INPUT/PRINT, operators, and conditional statements to build the first version of the project.

1. Guided Coding

Study the example code below with your team. Type it into your editor and run it. Do not copy and paste.

```
print("=" * 40)
print(" Week 1 - Character Setup")
print("=" * 40)

name = input("Enter character name: ")
job = input("Choose job (warrior / mage): ")

hp = 100
gold = 30

if job == "warrior":
    attack = 15
elif job == "mage":
    attack = 20
else:
    attack = 10

print("Name   =", name)
print("Job    =", job)
print("HP     =", hp)
print("Attack =", attack)
print("Gold   =", gold)
```

2. Team Coding Tasks

1. Add a defense variable and assign a different value for warrior, mage, and any other job.

2. Ask whether the player wants to buy a potion for 10 gold.

3. If the answer is y and the player has enough gold, subtract 10 gold and increase HP by 20.

4. Run the program with at least two different jobs and confirm that the results change correctly.

3. Expected Output / Checkpoint

```
Enter character name:
Alex
Choose job (warrior / mage):
warrior
Name   = Alex
Job    = warrior
HP     = 100
Attack = 15
Defense= 10
Gold   = 30
```

4. Submission Check

- The program runs without errors.
- The program runs from beginning to end.
- Every team member can explain the code added this week.
- Save the completed source code as week1_project.py.
